Collate
Index Mark

1. The first step in the process of creating a new product is to identify a market need. This involves conducting market research to determine what consumers want and need. Once a need is identified, the next step is to develop a concept for a product that meets that need. This is followed by creating a prototype, which is a preliminary model of the product. The prototype is then tested to see if it meets the requirements of the market. If it does, the product is ready for production. If not, the process is repeated until a product is developed that meets the market need.

1. **Identify the problem.** The first step is to identify the problem. This involves understanding the symptoms and the context in which they are occurring.
